

Project Design Phase Solution Architecture

Date	29 June 2026
Project Name	Library Book Request Management System
Maximum Marks	4 Marks

Solution Architecture:

The **Library Book Request System** is designed using the **ServiceNow Zurich Platform** to automate the book request and librarian notification process. The goals of the proposed solution architecture are to:

- Automate the student book request and librarian notification process.
- Validate the issue date using a Business Rule to prevent past dates from being submitted.
- Auto-generate a unique request number for every new book request.
- Send email notifications to the librarian when a new request is submitted.
- Store book request records securely in the ServiceNow database.
- Provide a reliable, scalable, and user-friendly library management solution.

Example – Solution Architecture Diagram:

Student (Browser / Portal)	Browser Cache (Business Rule / Client Script)	sys_db_server (Database – x_lib_book_request)	ServiceNow Notification Engine	Librarian (Email Recipient)
Fills Library Book Request form and clicks Submit	Validates Issue Date (cannot be in the past) Aborts if invalid	Stores record with fields: • Number (LIB10001...) • Student Name • Student ID • Book Name • Author • Issue Date • Status	Trigger: record.created Sends sys_email notification to librarian email address	Receives email alert with full request details
→ Submit	→ Pass / Abort	→ Record saved (Data at Rest)	→ Email sent	→ Processes request
